

TWI

TALLYWEB TWI IS A SIMPLE CONTROL PANEL WITH MANY DIFFERENT OPTIONS FOR ACCESS CONTROL AND SETTLEMENT OF CONSUMPTION.

TWI access control has 4 function options, from which 1 of the options below is chosen.

- Door — Gives the user access to doors, gates, buildings etc.
- Boom control — With a "Boom in" and "Boom out" function.
- Payment — User payment for utilising: showers, washing machines and many other things.
- Electricity and water — Settlement of consumption.

TWI access control can be utilized in many different places.

It can operate as a regular access control that can control doors, gates and booms. The access control also includes "cross-referencing". I.e. you can apply it for a boom in and out, and it will make sure that no more entries are allowed on the same code until they have left. In this way you prevent campers from taking too many cars into a campsite.

The TWI can also accept payments for things such as baths, clothes washing, etc. There are lots of possibilities.

Electricity and water consumption can also be controlled and measured, and power can be sold in packages, allowing for the reimbursement of electrical expenses.

The TWI is controlled by radio, as a part of Tallyweb, and the access control encountered by guests remains the same, regardless of what they are operating.

The TWI is, of course, online, and it can be integrated with third-party systems.

Door:

- The TWI allows access on several cards and codes per guest. A green light on the access control indicates when it is open.
- Can be set up with 1 or 2 active periods. Can be permanently open or permanently shut.

Boom:

- The TWI access control for "boom control" provides card and/or code access — a green light on the access control indicates when it is open.
- This allows users to drive in and check that the user drives out before another entry is allowed.
- Can be set up with 1 or 2 active periods. Can be permanently open or permanently shut.

Payment:

- The TWI access control can be used to pay for things such as showers, washing machines, pillar cranes, etc. via a code and/or a card — a green light on the keypad indicates whether it is active.

Electricity and water:

- The TWI access control for consumption payments can be activated via a code, a card or a smartphone — a green light on the access control indicates when it is on.
- The payment method for water and/or electricity is defined, eg. as per. kWh or per "power package" or per day, etc.
